I found a free program from here: <http://www.globalaudiocontrol.com/>

that allows a person to adjust the volume from the keyboard, or command line!!!

Here is a batch file I made to make the volume half :

"C:\Program Files\Global Audio Control\Global Audio Control.exe" -SET MASTER VOLUME: 30000 -close

Now, I didn't the program running on startup, so I disabled in msconfig.

The batch file opens the program just long enough to adjust the volume, then

-close closes the program when finished.

It does a lot more things!!! It can set the midi volume, and the wave volume.

Volume setting is 0 - 65535

msil217,

Thanks for the heads up. I am sure that someone will find this helpful although I have always been happy just controlling the volume from the windows master volume control.

I always like to find ways to automate anything. One way the program could be handy is while playing a large music collection, you could set the volume to jump high or low at a certain time. Now, what would be cool is making an event occur when a certain song is played. Maybe boost or lower the volume, or other tasks.
